

PURPLEOSIER WILLOW

Salix purpurea L.

plant symbol = SAPU2

Contributed by: USDA NRCS Plant Materials Program

Big Flats Plant Materials Center
Big Flats, New York

Uses

Purpleosier willow is used extensively in soil bioengineering systems and to control erosion along streambanks resulting from flood and ice damage. Its fast growth, resilient stems, and ability to recover from mechanical damage make it an ideal plant for this use. When used in this manner, it provides cover for small animals and browse for deer, beaver and rabbits and exceptional nesting sites for birds. The whips are useful in vineyards for tying up grapevines and also for basket making. This species was brought to North America by the Europeans and grown for these purposes.

Status

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant's current status (e.g. threatened or endangered species, state noxious status, and wetland indicator values).

Description

Purpleosier willow is a medium to tall introduced shrub growing 10 to 20 feet high, with smooth, slender, tough, resilient branches, purplish at first but later changing to gray or olive-gray. The leaves arise in pairs but not quite oppositely, are smooth tongue-

shaped, finely-toothed near the tip only, 2 to 4 inches long, bluish-green above and pale below. The catkins are small, arise in almost opposite pairs, and mature in spring before the leaves come out. Male and female flowers are borne on separate plants. Purpleosier willow is a solitary shrub, sending up many branches from the base. It rarely spreads by layering of branches. Growth is rapid, reaching from 2 to 8 feet in two years; often to full height in five years.

Adaptation

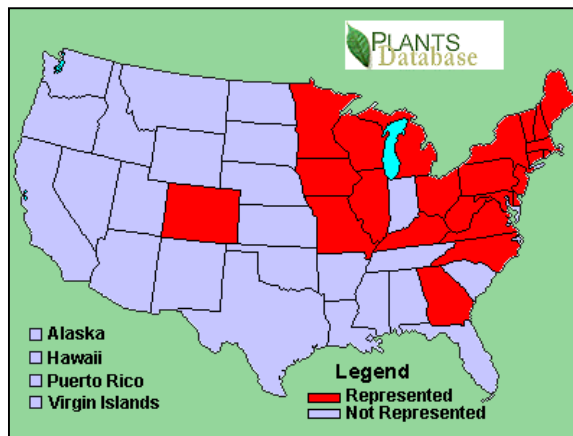

Purpleosier willow is climatically adapted to all the northeastern states. Well-drained to imperfectly-drained soils are most suitable for this species. It can be used on soils of any texture, but makes best growth on silt loams.

Establishment

Purpleosier willow is susceptible to severe browsing by livestock and cannot be established without protection. Banks that are eroded and undercut to a steep unplatable slope require grading prior to planting.

Cuttings Plant as one year old rooted cuttings, or dormant hardwood cuttings. If dormant cuttings are used, they should be 3/8 to 1/2 inch at the thick end, 12 to 15 inches long, and made before the leaves emerge. Dormant cuttings should be planted vertically with only an inch or two protruding. If they cannot be pushed in the soil by hand, use a rod to make a hole but be sure the cutting is tamped in well with the heel to avoid leaving any air spaces. If the soil is too stony to for this technique, the cutting may be buried horizontally about one inch deep in damp soil. Rooted cuttings should be planted in a hole dug big enough to accommodate the root system when well-spread. On difficult streambanks, it is sometimes necessary to mulch the

planting with coarse plant material, even wiring and staking the mulch down in some cases. Plant at 2 to 3 foot spacing from just above water's edge or rip-rap, to the top of the bank.

Soil Bioengineering Uses Dormant whips are very useful when bundled into wattles (live fascines) or for brush layering and mattressing systems. Stem sections work well in live staking systems, and larger diameter (1 1/2-2 inches) older stems are useful in pole applications. 'Streamco' willow can be produced in the nursery to specification to meet all the above uses. Planting methods for soil bioengineering are regionally varied. Consult with the Plant Materials Specialist for planting recommendations.

Management

Purpleosier willow used on streambanks may experience mechanical damage. The site should be inspected annually in spring, after heavy run-off has subsided, for needed repairs. Gaps should be filled in by replanting, or laying down and covering branches of nearby plants. Any mechanical measures used to control the bank, as for example, stone rip-rap, must be kept in repair as well.

Pests and Potential Problems

This section is under development.

Cultivars, Improved, and Selected Materials (and area of origin)

A variety of purpleosier willow, 'Streamco,' was released by the Big Flats Plant Materials Center in 1975. 'Streamco' is a male clone and does not root sucker, so it does not spread. Rooted and unrooted cuttings, whips, and wattles can be purchased from a variety of nurseries in the Northeast.
